

Quality Assurance – Robin Pako Taolo

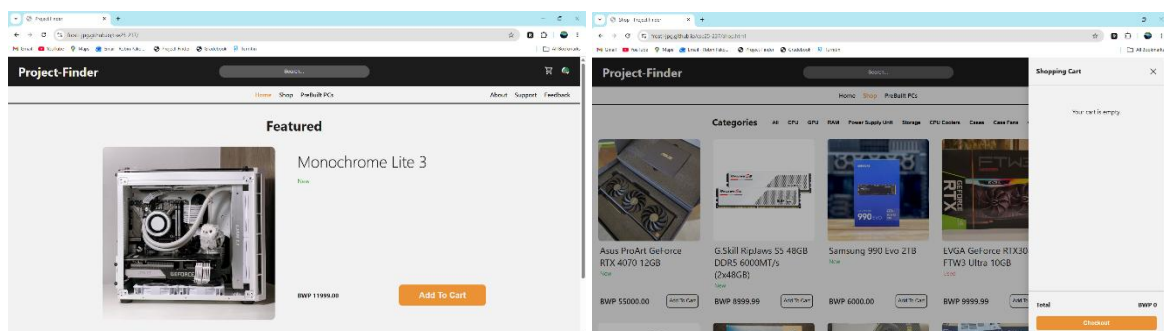

CSE25-237

Browser Compatibility tests were performed to ensure the website displayed consistently across different browsers and operated as expected. The browsers used to perform the test were Google Chrome, Microsoft Edge and Samsung Browser on Windows 11, and Safari and Google Chrome on MacOS Monterey.

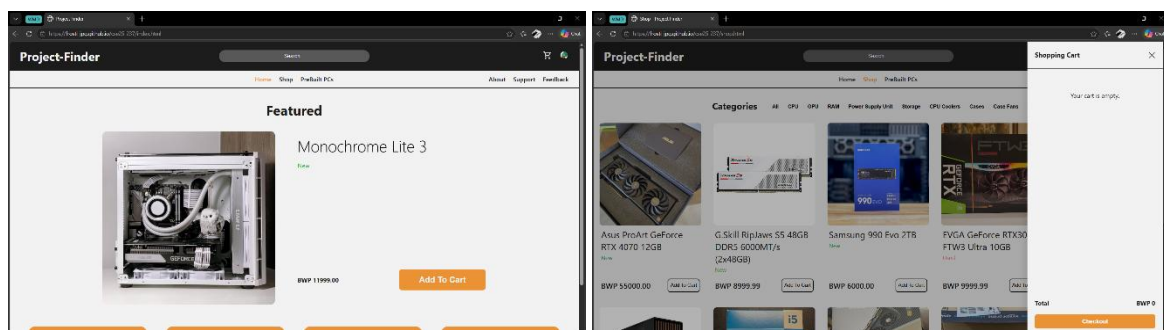

Some of the variables focused on during testing were that all navigation links worked, layouts did not break, images rendered quickly, responsiveness of the website, and consistency in the CSS styling.

Google Chrome, Microsoft Edge and Samsung Browser on Windows 11 all kept consistent appearance and layouts. Images rendered quickly, all links and buttons operated as expected and were responsive which resulted in a pass.

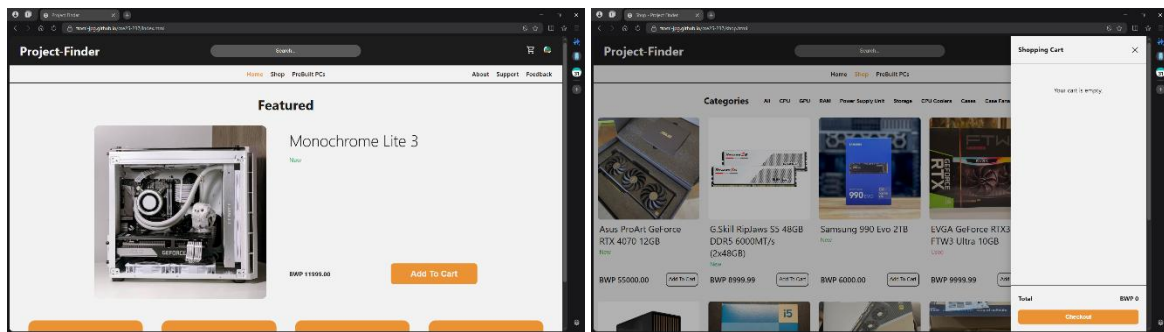

Google Chrome (Windows):

Microsoft Edge (Windows):

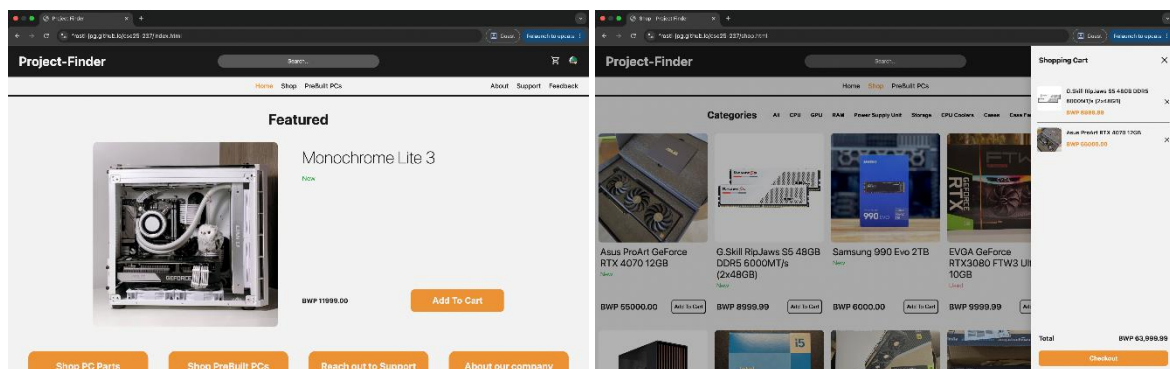

Samsung Browser (Windows):

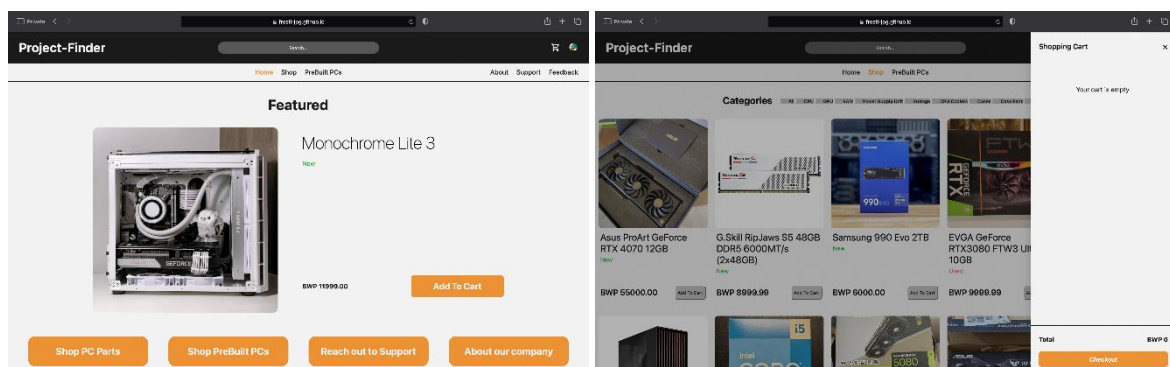

Google Chrome on MacOS also kept consistent appearance and layout. All images rendered correctly and quickly, all links and buttons function correctly and are responsive which results in a pass. Safari has some button styling inconsistencies compared to the others, but navigation and all other functionalities were normal. It also passes because functionality remains.

Google Chrome (MacOS);

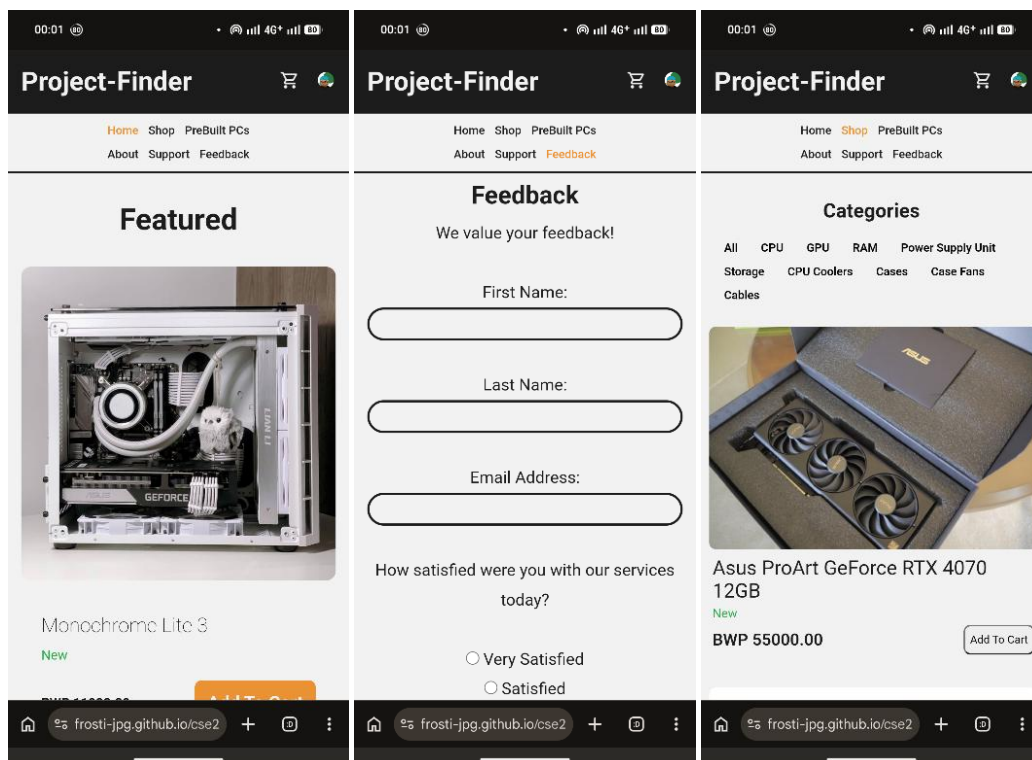

Safari (MacOS):

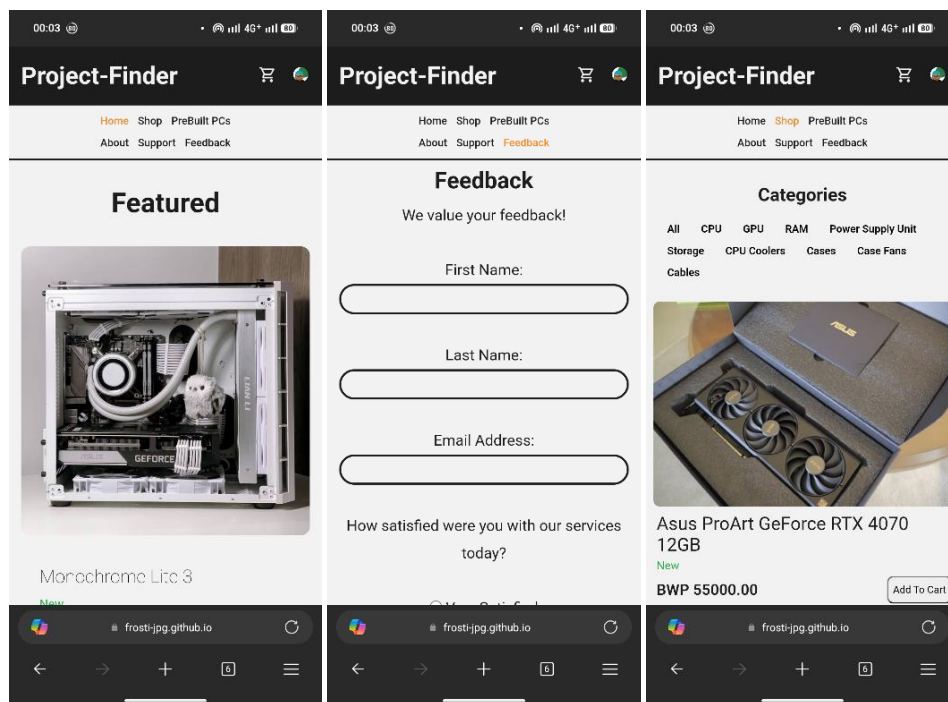

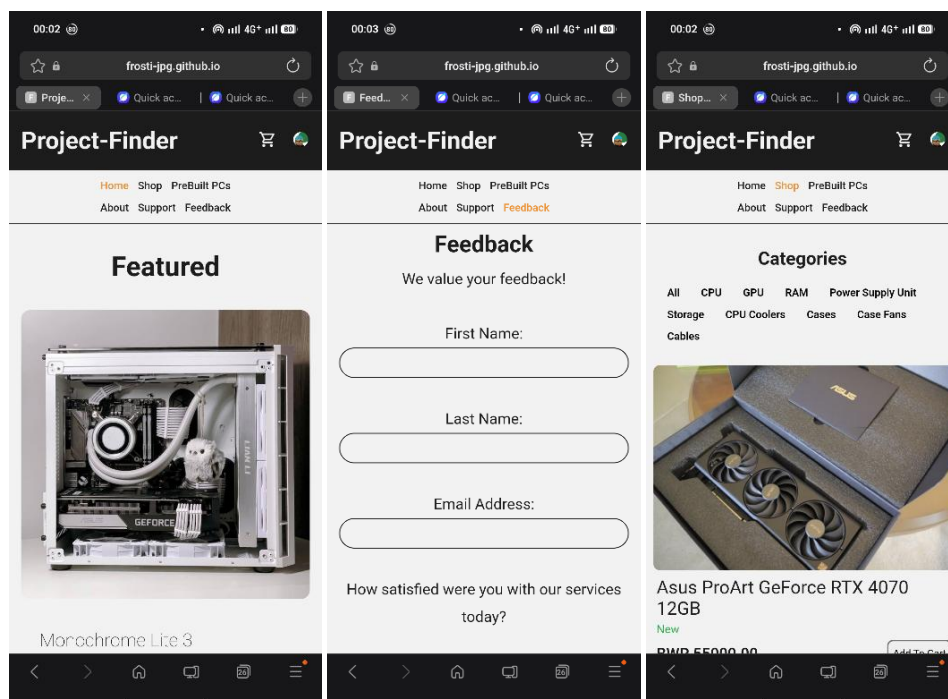

Mobile testing was also conducted to verify that the website would indeed be usable on smaller screens. The browsers used to perform these tests were Google Chrome, Microsoft Edge and Samsung Internet.

The website scaled properly to fit the smaller screen on all three of the web browsers during tests. Inside Google Chrome, Microsoft Edge and Samsung Internet, website Information was still readable on the smaller screen, images scaled correctly and the CSS was picked appropriately for the size of the screen. This meant that layouts were adjusted accordingly. Buttons and links remain interactive and forms are still usable. Both functionality and layout give the test on all the browsers passes.

Google Chrome:

Microsoft Edge:**Samsung Internet:**

Overall testing the tests showed consistent website behaviour across both desktop and mobile devices. There were minor styling differences in Safari on MacOS that affected button appearance, however no functional issues or broken navigation were identified.
